Description Module

Transport Accounting – Route, Country VAT & Invoice Calculator

An accounting and invoicing tool designed specifically for transport companies. It works alongside your existing accounting software, as long as the accounting program supports XML import.
The purpose is to greatly simplify the preparation of transport invoices by automatically calculating route distances, separating domestic and international kilometres, apply different VAT TAX rules and country-specific requirements, generating suitable invoice descriptions, and preparing the data for PDF or XML export.
Instead of manually calculating kilometres, separating routes by countryes, their vat, tax and entering the same information again into your accounting software, the tool prepares the necessary invoice data for you and allows it to be imported directly into your existing accounting system.

Workflow

?? 1.

Route Calculation

Calculate routes with pickup, drop-off, extra stops, and return trip support using Google Maps.

? 2.

Country Split

Estimate kilometre split between the country of origin and foreign countries for accounting. auto apply different VAT TAX rules and country-specific requirements

?

Invoice Export

Generate PDF invoices and export invoice data in XML for diferent accounting workflows.

Features

Designed for taxi companies, passenger transfer providers, and transport operators who need accurate route-based invoice.
How It Works (Simple 3-Step Explanation)
Instead of manually checking maps and looking up foreign tax rates, an accountant only needs to do this:
1. Enter the route: Type in the pickup and drop-off locations (e.g., Ljubljana -> Milan) add any additonal cost, like parking ec..
2. Automatic calculation: The extension automatically splits the trip into kilometers per individual country (Slovenia, Italy, Croatia, Germany...) and applies the correct local VAT rates.
3. Export to accounting: With a single click, it generates a PDF invoice or an XML file for direct import into your accounting software.

Google Maps route calculation with pickup, drop-off, extra stops, and return trip support
Country-of-origin and foreign-country kilometre split
Apply different VAT TAX rules and country-specific requirements,
Add additional costs to the calculation, such as driver accommodation, parking fees, tolls, and other expenses.
Gross price, net price, VAT, and taxable base calculation
Saved customer details and reusable invoice history in Joomla database tables
PDF invoice generation
XML export for supporting accounting software
Configurable company details, origin-country accounts, and foreign-country accounts
English is the default language, but the extension can be translated into any language using Joomla language files.

Demo

Try the working demo and see how route calculation, invoice preparation, and export workflows work in practice.
